

# Euclidean Geometry

January 24-26, 2017

# Geometry

- Geometry = geo(earth) + meter (measure)
- The first ideas of geometry come from nature:
  - the shapes of mountains resemble triangles
  - The sun and moon are circular in the sky
  - Flowers and fruits display more complex shapes

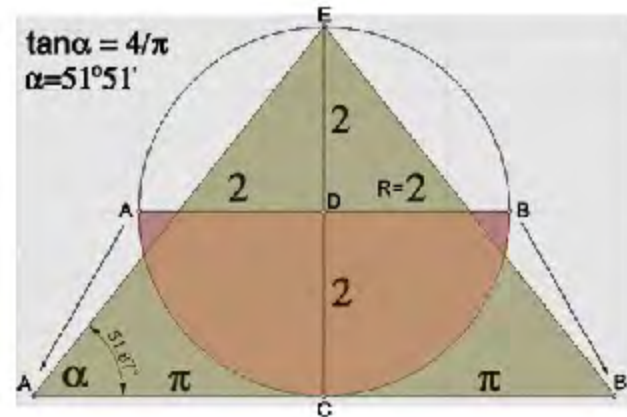

# Historical development

- Egyptian civilization
  - Pyramids

## Egyptian Hieratic Numerals

1		10	∧	100	—	1000	Ⲕ
2		20	λ	200	—	2000	ⲔⲔ
3		30	χ	300	—	3000	ⲔⲔⲔ
4		40	ⲗ	400	—	4000	ⲔⲔⲔⲔ
5	Ⲙ	50	ⲛ	500	—	5000	ⲔⲔⲔⲔⲔ
6	ⲙ	60	ⲛ	600	—	6000	ⲔⲔⲔⲔⲔⲔ
7	ⲙ	70	ⲛ	700	—	7000	ⲔⲔⲔⲔⲔⲔⲔ
8	≡	80	ⲛ	800	—	8000	ⲔⲔⲔⲔⲔⲔⲔⲔ
9	ⲙ	90	ⲛ	900	—	9000	ⲔⲔⲔⲔⲔⲔⲔⲔⲔ

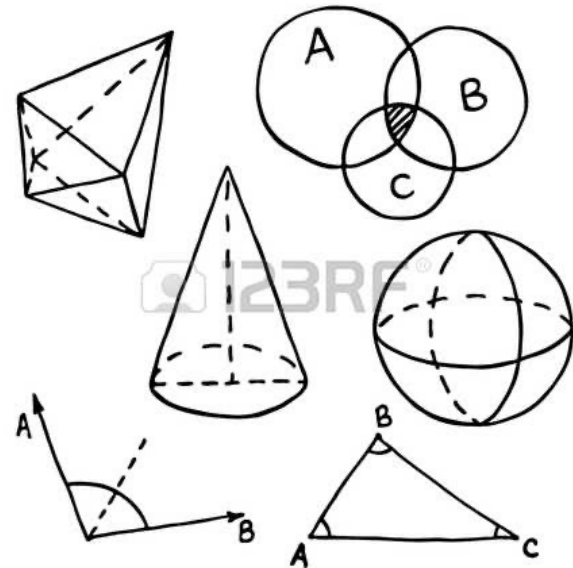

So, e.g, 1328 = ≡λⲙⲔ

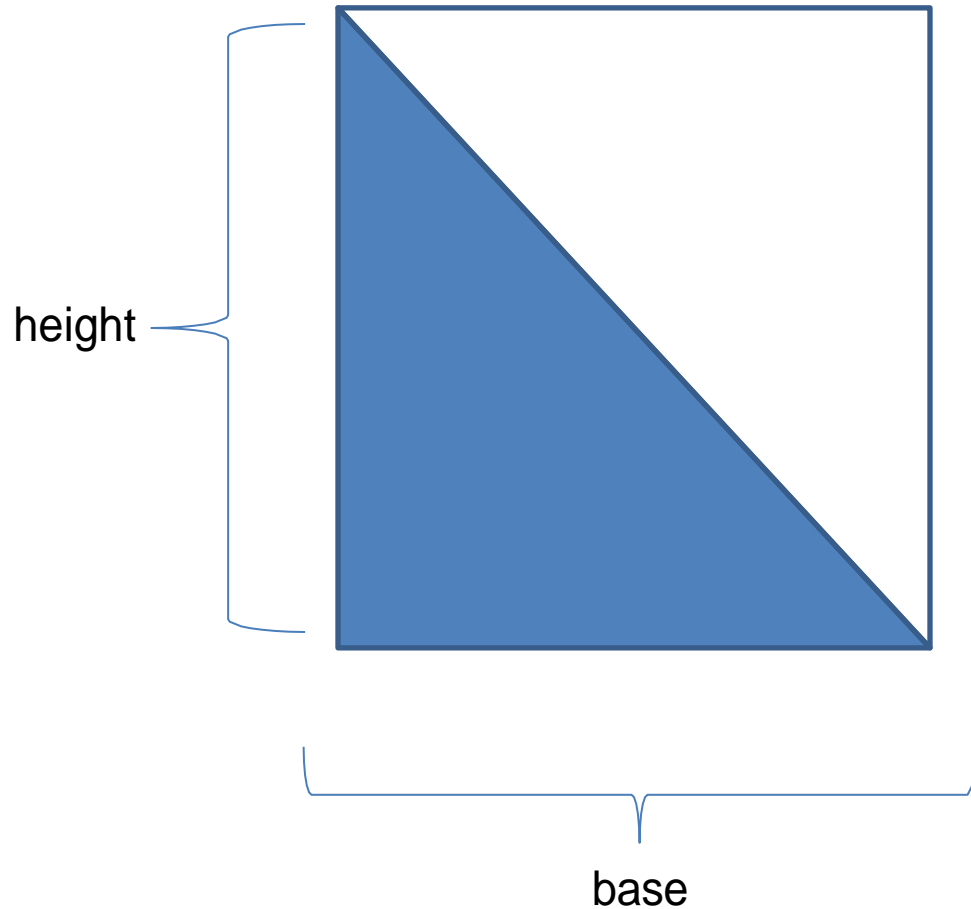

- Greek civilization
  - Thales (624-548 BC)

- Pythagoras (580-500 BC)

# The area of a triangle

Area of triangle =  $\frac{1}{2}$  base x height

# Class Exercise 1

- Find the area of these scalene triangles.

# The Theorems of Thales

1. A circle is bisected by a diameter.
2. The base angles of an isosceles triangle are the same.
3. The pair of vertical angles formed by the intersection of two lines are equal.
4. Two triangles are **congruent** if they have two angles and included side equal.
5. An angle inscribed in a semi-circle is a right angle.

SSS (*Side – Side – Side*)

3 sides are respectively equal

SAS (*Side – Angle – Side*)

2 sides and the included angle are respectively equal

ASA (*Angle – Side – Angle*)

2 angles and the included side are respectively equal

RHS (*Right angle – Hypotenuse – Side*)

Hypotenuse and one side are respectively equal

# Similar triangles

- Triangles  $AYB$  and  $HYV$  are **similar**.
- These triangles have 3 angles the same (AAA) but not the sides.

# Axiomatic Method

- “The term **axiomatic geometry** can be applied to any **geometry** that is developed from an **axiom** system, but is often used to mean Euclidean **geometry** studied from this point of view.” (Wikipedia)

# Euclid's postulates

1. A straight line segment can be drawn joining any two points.
2. Any straight line segment can be extended indefinitely in a straight line.
3. Given a straight line segment, a circle can be drawn having the segment as a radius and one endpoint as center.
4. All right angles are congruent.
5. Given any straight line and a point not on it, there exists one and only one straight line which passes through that point and never intersects the first line.

# Euclid's postulates

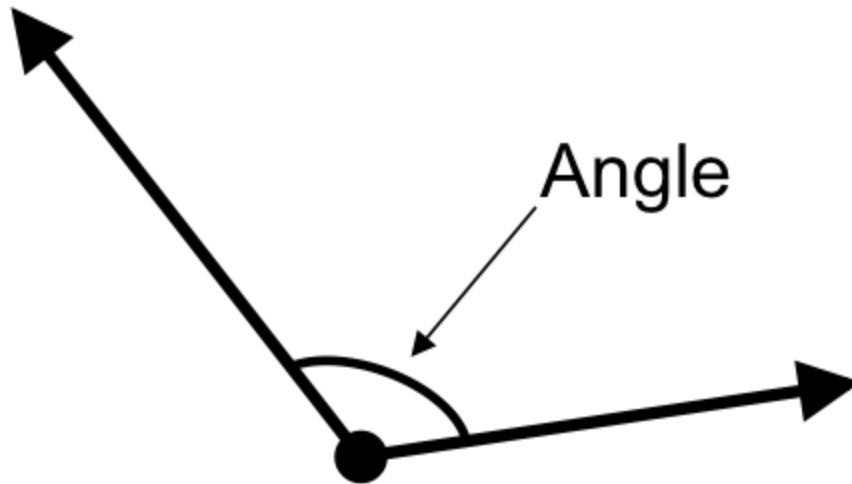

# Class exercise 2

- Consider the following axioms:
  1. There are 3 students.
  2. For every pair of students, there is exactly one class in which they are enrolled.
  3. Not all students belong to the same class.
  4. 2 separate classes share at least one student in common.

What can you deduce from these axioms?

# Definition of angles

Acute Angle

Less than  $90^\circ$

Right Angle

Exactly  $90^\circ$

Obtuse Angle

Greater than  $90^\circ$  but  
less than  $180^\circ$

Straight Angle

Exactly  $180^\circ$

Reflex Angle

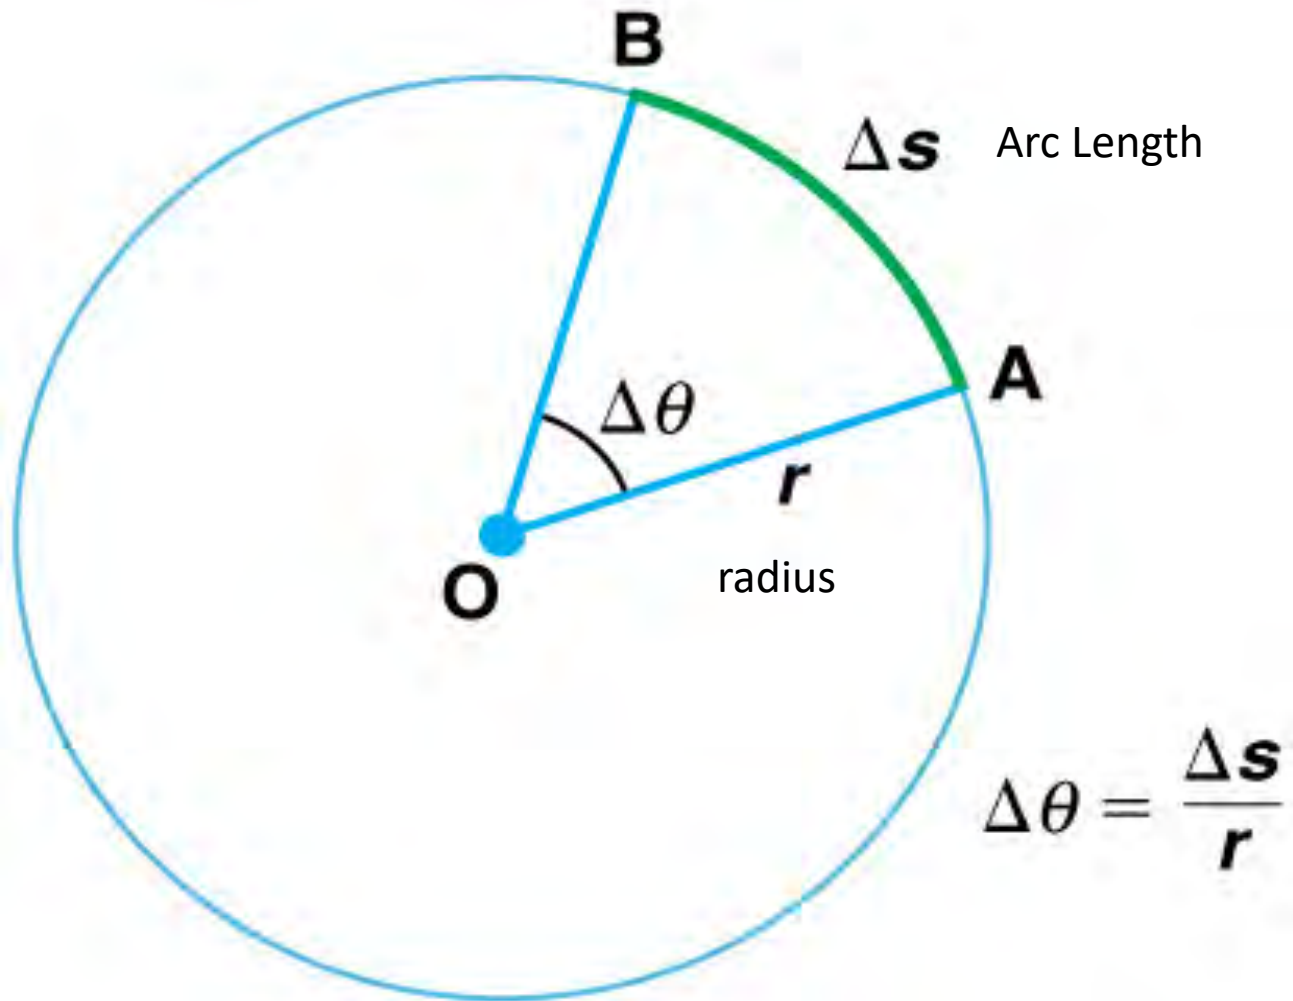

Greater than  $180^\circ$

Full Rotation

Exactly  $360^\circ$

# Definition

# How we measure angles

- The radian is one measure of angle. In radians, the angles can vary between 0 and  $2\pi$ .
- What is the circumference of a circle of radius  $r$ ? Can you relate this to the definition of the angle provided earlier?
- Angles can also be expressed in degrees, between 0 and 360.
- How is a radian related to a degree?

# Class exercise 3

Consider the following picture

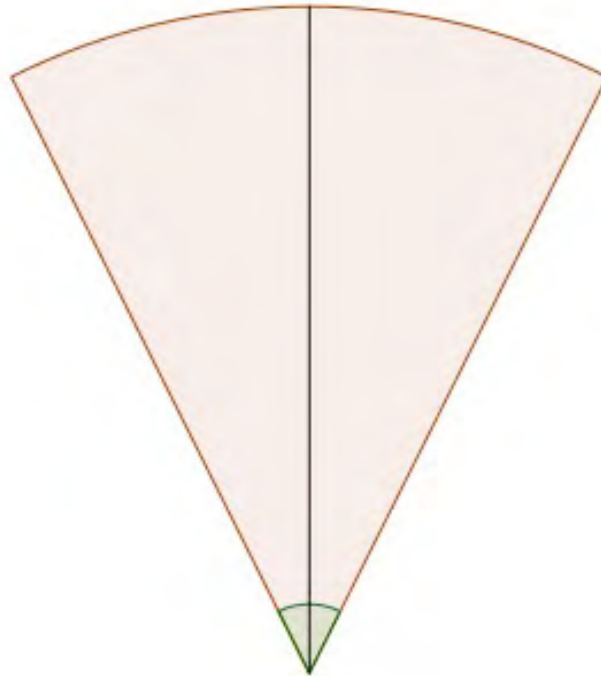

# Exercise 2 - contd

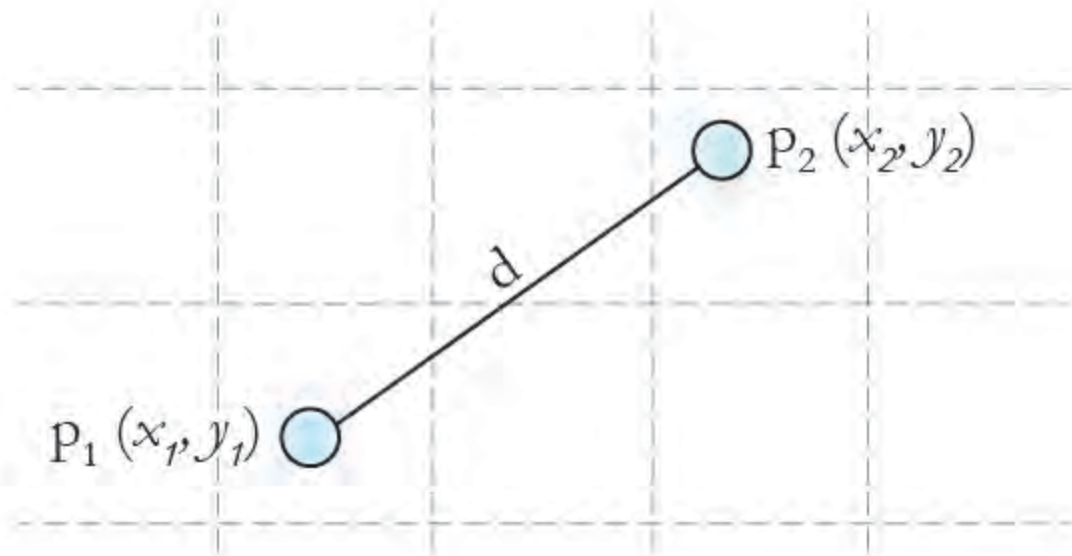

- Find the arc length, radius and angle corresponding to segments:
  - AB
  - CD
  - EF
  - GH
  - IJ
- What underlying pattern do you think exists in this picture?
- Graph the arc length vs. radius for the different segments.
- What do you infer from this?

# Class exercise 3

- Arc length lab (ropes and meter sticks)

# Euclidean distance

$$\text{Euclidean distance } (d) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

# Class exercise 4

- Find the distance between the front of Science Hall and the spot in front of the Student center, as indicated by the red line in the picture.

# Homework problem 1

- Consider the following 3 axioms:
  - *There are 5 flavors of ice cream: Vanilla, Chocolate, Strawberry, Bubble Gum and Cookie Dough.*
  - *Given any 2 flavors, there is one child who likes these 2 flavors.*
  - *Every child likes exactly two different flavors among the five.*
- Use these axioms to determine how many kids there are. Show the logic behind your work and also show that your result satisfies each of the axioms.

# Homework problem 2

- Use the concepts discussed in class to determine the height of the highest point of Richardson Hall.
- The only tools you are allowed to use are a pencil and a 12inch ruler.
- Explain your thought process and show all calculations. Include all the ideas that you thought of, even if you did not try them out.
